# How I built my AI marketing system in Claude

*The thinking behind it. How I build each skill from real work, the two bits almost everyone skips, and enough to build your own.*

**A free guide by Tamas Mihaly**

Founder of Thriving Colibri · AI-native marketing

**FREE GUIDE · NO CODE, NO JARGON**

For the last few weeks I've been building my own AI marketing system inside Claude. A chain of skills, each one doing a single job, each one trained to write in a real person's voice.

I've run it on my own businesses and on paying client work. A full SEO audit. Content briefs. Pages that had to rank and convert. Some of it held up first time. Some I rebuilt three times before it stopped embarrassing me.

This guide is the thinking behind it. What these skills are. How I build them. The two bits that make the difference. By the end you'll have enough to build your own. And if you'd rather not, you'll know exactly what mine do.

No code. No jargon. If you've had a go with AI for marketing and it never quite clicked, this is probably the bit you were missing.

---

## First, what these actually are

These are not "ask Claude to write me a brand-context skill" and done in ten seconds. Anyone can generate a skill file in a minute. It comes out generic, and it shows.

What's inside mine is over ten years of marketing. Freelance, in-house, agency. Every skill carries decisions I learned the hard way. What a good brief actually contains. How to read what someone's really searching for. What makes a sentence sound like a person and not a robot.

They're built from real client work and sharpened over weeks of using them on that work. The experience is the thing you're paying for. The skill is just where I keep it.

A prompt pack can't do that.

---

## How I build a skill (the actual method)

This is the part I most want to give you, because nobody explains it.

1. **Do the real work first.** I don't sit down to "build a skill." I do the actual job. An SEO audit. A client's content plan. A Google Ads strategy. Then I build the skill out of that work. You can't design a good skill in the abstract.
2. **Fine-tune it on the next job.** Every time I run a skill on real work, it shows me where it's thin. I fix it. The next job sharpens it again. You need real work to fine-tune a skill. That's the whole reason off-the-shelf skills stay generic. They've never been tested on anything real.
3. **Let it stack up.** Each skill reads the one before it, so the business never gets explained twice.

Real work in. Fine-tune. Repeat. Slow at first. Then it pays you back every day.

---

## "But I can just do that with a prompt"

A mate said this to me the other day: "I can do this myself. I drop my website into ChatGPT, ask it for a tone-of-voice doc, and paste that in when I need it."

Fair. I get why it looks the same from the outside. Here's why it isn't.

A prompt is a one-off. You paste it, you babysit it, and you explain your business again every new chat. A tone-of-voice doc tells the model to "sound friendly." It doesn't make anything actually sound like you, and it can't prove it did.

A skill is saved, and it runs the same way every time. It reads your brand and your voice on its own. It hands its work to the next skill in the chain. And the voice part isn't a vibe. It's captured from your real writing and checked with a score (more on that below).

The prompt is a single sentence you paste in. This is the whole job, set up to run the same way every time.

---

## What's actually inside one of my skills

There are loads of free marketing skills online. I've shared a few myself. Most of them are one file. A single instruction file you drop in, and off it goes. It works the same for everyone, which means it knows nothing about you or your work.

Mine are a folder. The main file is the front door. Behind it sits a stack of little files that do the real work. Here's what that looks like in my own setup:

- **Brand context** carries templates for the brand, the visual identity, and the voice fingerprint.
- **Content creation** carries separate files for human voice, page patterns, the SEO and AI-search rules, output format, and a quality-check gate.
- **Paid search** carries files for ad-copy craft and keyword modes, plus actual scripts that check the ads are valid and export the whole campaign to a spreadsheet.
- **Content strategy** carries a brief template and an ideation toolkit.
- **The newsletter skill** carries the structure, the subject lines, an ingredients check, and the footer.

Anyone can get Claude to write a one-file skill in a minute. These little files are the bit that took the work. They're built and fine-tuned from real jobs, and they're the reason the output doesn't come out generic. That stack is the actual thing.

---

## The system, skill by skill

Build that way and you end up with a chain. Mine runs top to bottom:

**Brand context → Keyword research → Content strategy → Content creation → Humanize → AI visibility**

- **Brand context.** Captures the business once. Positioning, audience, offer. Saved to one file every other skill reads. It also holds the voice fingerprint (below).
- **Keyword research.** Turns a few seed ideas into a clustered, prioritised plan you'll actually use. Plugged into DataForSEO, so it costs pennies. 400 keywords cost me five pence the other day.

- **Content strategy.** Decides what to make, who for, and in what order. Writes a proper brief for each piece. Get the brief thin and everything after it is thin.
- **Content creation.** Takes one brief and writes one finished piece, built to rank on Google and get picked up by AI.
- **Humanize.** Strips the AI tells out of a draft and proves it with a score. Rewrites toward your voice fingerprint.
- **AI visibility.** Gets the business mentioned by ChatGPT, Perplexity and Google's AI answers, then tracks whether it's working.

---

## The two bits almost everyone skips

**The voice fingerprint.** A separate file that captures how one specific person writes. The rhythm. The phrases. The words they'd never use. Swap the file and the whole system writes as me, as one of my businesses, or as a client. Most AI content fails for one reason. It reads like AI, and everyone can smell it now. One thing I learned the hard way: this only works on writing samples that weren't already tidied up by AI. Feed it AI writing and all you capture is the machine.

**Here's what that actually looks like. Same idea, written two ways.**

### STRAIGHT OUT OF CHATGPT

*"In today's fast-paced digital landscape, I've been on a journey to build a suite of powerful AI skills that seamlessly elevate your marketing — it's not just about automation, it's about unlocking your brand's true potential."*

### IN MY VOICE

*"For the last few weeks I've been building my own Claude skills for marketing. Then testing them on live client work. A full SEO audit. A cold email sequence. Some held up. Some I rebuilt three times."*

You can feel which one a person wrote. That gap is the whole job.

**The refine loop.** The workflow that actually runs. The system writes draft one. I give feedback out loud. It writes draft two. I do the final edit. I freeze at a blank page, always have. But I can talk for hours about something I know. So I never start by writing. And the feedback feeds back into the voice fingerprint, so draft one gets a bit better every time.

---

## What's coming next

The six above are the core. There's more already built. A paid search skill. A web design skill. A newsletter skill. And a stack under testing right now: paid social, email marketing, conversion optimisation, ad creative, a sales skill, an SEO audit skill, analytics, competitor research.

More on the way after that. That's the point of building it like this. The library keeps growing, and every new skill reads the same brand and the same voice as the rest.

---

## Why I think this is here to stay

The tools I use today won't be the tools I use next year. The models will get better. Some app I rely on now will be gone by Christmas.

The way of working won't change. One job per skill. Your brand and voice captured once. Your judgement on top. AI does the heavy lifting, you bring the thinking. That part sits above the tools.

Swap the model and the process still runs. This is how the work gets done now, and I think it stays that way.

---

## Honest about where the work still is

The system gets you most of the way. Some pieces only need a quick read and a small change before they go out. The ones that matter, I run through the refine loop a few times until the final is genuinely good, then I ship it.

You stay in it, though. The judgement and the final call are yours. Anyone selling you hands-off AI content that's genuinely good is either editing in secret or shipping rubbish.

### Start here

Want to try it? Start small. Open Claude and feed it a few real writing samples. If it's you, three things you actually wrote. If it's a business, your existing website pages or a tone-of-voice doc. Ask it to capture how you write into a short file. That's your voice fingerprint. Use it on the next thing you write.

**That's skill one, started.**

---

## Want the ready-made skills?

If you'd rather not build all this yourself, you can get mine. The same skills, already built and tested on real work, set up to run on your own brand and your own voice.

I've put the details on a separate page, so this guide stays what it's meant to be: the method, yours for free.
